

Stricter compliance regulations and internal mandates are pressuring today's Chief Security Officers (CSOs) within Fortune 1000 organizations to implement effective and efficient solutions to protect global assets.

Security personnel find themselves overwhelmed with large amounts of information from many disparate systems, which results in slow response to incidents, inefficient use of resources and increased security risk. The problems intensify as organizations implement new technologies and integrate related security systems such as IT, communications and building management systems.

Furthermore, existing systems fall short in giving corporate security teams an accurate picture of their environment to measure results and inefficiencies.

Discover. Connect. Resolve.

Proximex Surveillint™ is a premier physical security solution for policy-based incident discovery, connection and resolution. Powered by a sophisticated business logic engine, Surveillint integrates disparate security systems and transforms the information into usable, actionable intelligence based on security policies to mitigate risk across an enterprise, speed security incident resolution and reduce security operations costs.

Discover.

Surveillint easily integrates and displays sensors, incident and related information from virtually any security or security-related system to immediately monitor and control resources from a centralized platform.

Connect.

Surveillint correlates relevant information and incidents from multiple systems making it easy for

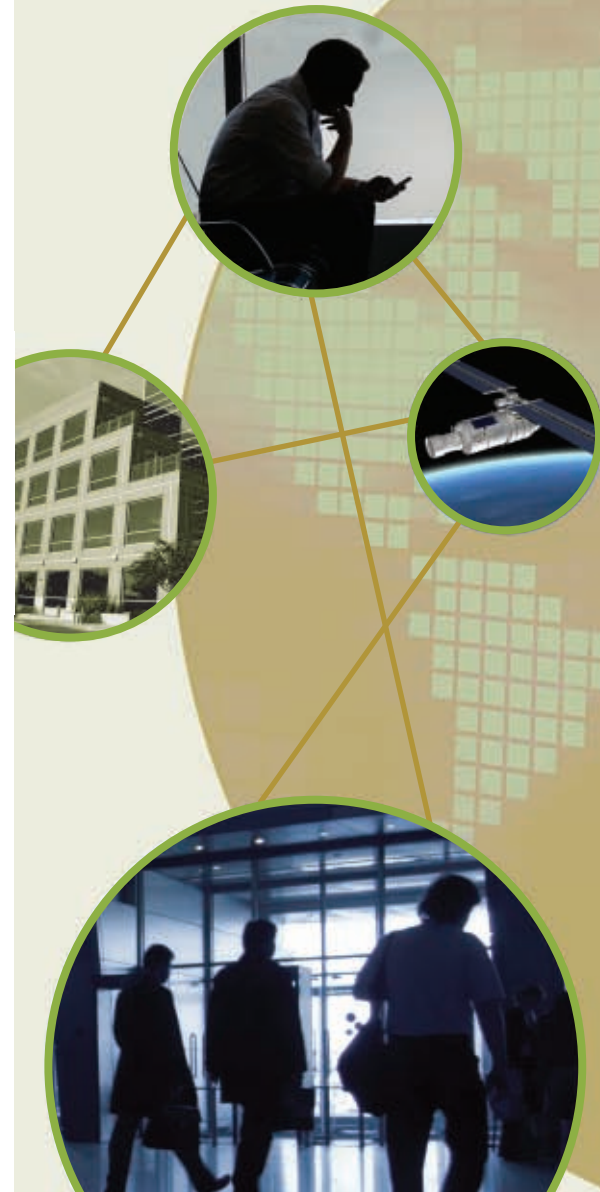

operators to immediately analyze related information and for security teams to automatically correlate related incidents to further reduce false alarms and to speed incident response time.

Resolve.

Surveillint helps resolve incidents while eliminating the need to dispatch security guards. And, to complete the resolution process, Surveillint provides a wide variety of reports: incident, tracking and policy compliance reports, trend reports. Incident, tracking and policy compliance reports allow corporate security teams to enforce formal security policies. And, trend reports allow corporate security teams to gather the statistics required to improve their security program. For example, day of the week most alarms occur, sensors generating the highest level of alarms, incidents response times, and more.

Key benefits

- See complete picture of all security activity in a single view
- Control views and permissions for different user groups
- Integrate existing and new security systems
- Automatically connect related information
- Speed incident response times
- Drive enforcement of security policy
- Eliminate hours of laborious tasks, errors and inefficiencies

Key capabilities

Centrally Monitor and Control Security Systems

Surveillint offers a complete picture of all security activity – in a single view, in real time – so it's no longer necessary to watch all the consoles at the same time.

- Work within an easy-to-use and intuitive interface
- Manage and prioritize alerts based on rules
- Watch live and recorded video
- Snap video images and export video
- Control PTZ cameras and door access
- Deploy alerts to officers in the field
- Monitor security system health

Business Logic Manager

With Surveillint, organizations can now effortlessly enforce policies and procedures. Operators don't have to remember every mandated action but can focus on resolving the incident at hand.

- Employs a graphical, Visio-like interface geared towards the business user
- Eliminates the need for complicated coding
- Symbolize multi-layered policies in a handful of steps instead of thousands of rules
- Operates with drag and drop reusable activities to design, test and maintain business logic
- Define and automate tedious tasks and capture expert knowledge
- Manage response tasks related to required actions (workflow)

Incident Connection Engine

Surveillint offers much more than connecting incidents with related information from disparate security systems. It is the only solution to automatically correlate related incidents to further reduce the number of false alarms.

- Connect incidents with related information
- Correlate related incidents to further reduce false alarms

Flexible Reporting

To help support the security team's value within the organization, Surveillint provides automated, yet configurable, reporting. It also eliminates laborious hours generating reports by hand and verifying accuracy.

- Develop incident and suspect tracking reports
- Generate trend and audit reports

PocketSurveillint™

PocketSurveillint eliminates the risk of miscommunication and the need to translate incident information verbally to officers in the field.

- Notify first responders with speed and accuracy

- Provides two-way communication between the security office and field officers

GIS Visualization

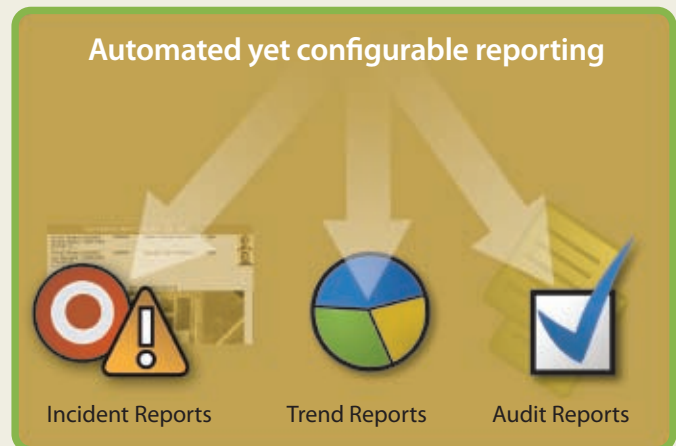

GIS integration with Surveillint leverages the power of GPS map details so security personnel can better visualize their security zones and track resources.

- Drill down through maps and display security resources
- Track location of field officers or other location-based services via GPS

Open Platform for Integration

The open and flexible platform of Surveillint and its ability to deliver commercial, off-the-shelf (COTS) integration means it's the right solution for any security environment, large or small. Designed with a service-oriented architecture (SOA), the Surveillint platform can scale to support thousands of sensors and virtually any type of security system, including ACS, video, intrusion, access control as well as advanced technologies, such as video analytics, radar, biometrics, RFID, etc.

- Integration with virtually any security or security-related system
- Bi-directional communication with systems
